

Production Efficiency

Production efficiency is a critical part in reducing UKCS operational emissions to net zero.

A 10% increase in offshore production efficiency enables a 4% reduction in emissions intensity.

A recent Asset Integrity Task Group study has shown that small bore tubing inefficiencies are one of the top causes of asset integrity production losses. Enough energy to power 23 cities and over £500 million is lost annually in the UKCS through these small-bore tubing production losses.

Tru-Fit® will help the UKCS reduce emissions intensity by reducing production losses and shutdowns caused by these small-bore tubing issues. Preventing leaks, fugitive emissions and unplanned shutdowns will contribute to the UKCS becoming the first net zero oil & gas basin.
